Introduction

Purpose & description

LarpRentals is a React-based single-page application (SPA) designed to allow users to browse, search, and analyse Australian rental properties sourced from a public domain Kaggle dataset. The application communicates exclusively with a published REST API hosted at <http://4.237.58.241:3000> and does not interact with any database directly. Users can filter properties by state, property type, suburb, postcode rent range, bedrooms, bathrooms, and parking availability. Authenticated users can additionally rate properties on a 1–5-star scale and view a history of their previously rated listings.

The application was built using React 18 with Vite as the bundler, React Bootstrap for component styling, and React Router v6 for client-side routing. Animation is handled by AOS (Animate on Scroll), mapping by Pigeon Maps, and icons by react-icons. The design is aesthetic and intentionally bold and contemporary. Drawing inspiration from premium property platforms with a dark navbar, hero imagery and card-based layouts. The About page features a thematic narrative around the brand identity, adding personality to an otherwise functional application.

Completeness and Limitations

The application successfully implements all endpoints exposed by the API, including all rental search filters, authenticated ratings (GET and POST), and user registration/login with JWT token management. The app is a fully routed SPA with no forced page refreshes. All core functionality specified for a grade of 7 has been implemented and functions correctly.

The Search page uses a custom virtualised scroll table that renders only visible rows via a virtual DOM window, accumulating all results across pages as the user loads more. A “Load more” button appends the next page of server results to the virtual table, providing an infinite-scroll-style experience without losing scroll position. Results can also be viewed as an interactive Pigeon Maps view, with all loaded properties shown as clickable map pins. Active search filters are displayed as removable chip badges. The RentalDetail page shows nearby properties in the same postcode as both a list and as blue map pins alongside the current property’s red pin. The About page uses correct public-folder image paths that resolve in the production build. All previously identified code quality issues have been resolved.

Use of End Points

All API endpoints are consumed with `src/api/rentals.js`, which centralises axios calls. Below is a summary of how each endpoint is used the application.

[/rentals/states](#)

Called on mount in `Search.jsx` via `getPropertyTypes()`. The response populates a Property Type dropdown filter. Like the states endpoint, this is fetched dynamically rather than hardcoded.

/rentals/search

This is the core endpoint of the application, consumed in Search.jsx via `searchRentals(params)`. The search form supports all available query parameters: `state`, `propertyType`, `postcode`, `suburb`, `minRent`, `maxRent`, `minBedrooms`, `maxBedrooms`, `minBathrooms`, and `minParking`. Advanced filters are hidden behind a collapsible panel to keep the UI clean for casual users. Sorting is supported via `sortBy` and `sortDir` query parameters, with a dropdown for column selection and a direction toggle. Results are fetched server-side in pages of 10 and accumulated into a virtualised table. To access more results, there's a "Load more" button fetches the next page and appends rows without resetting scroll position. If the URL already contains search parameters (e.g., from a bookmark or the "See all in [postcode]" link), the search executes automatically on mount, restoring the previous state. The endpoint is also called a second time within RentalDetail.jsx to load nearby properties sharing the same postcode.

</rentals/{id}>

Called in RentalDetail.jsx via `getRental(id)` when a user clicks a row in the search results or rated rentals table. The response provides detailed property information including description (rendered as HTML via `dangerouslySetInnerHTML`), street address, agency, amenities, bedroom/bathroom/parking counts, and geolocation coordinates. The coordinates are passed to Pigeon Maps to render an interactive map. A secondary call to `/rentals/search` is made to load nearby properties in the same postcode. These are rendered as blue marker pins on the same map alongside the current property's red pin, and as a clickable list card below the map.

CO-LIVING PROPERTY IN BOOMING STRATHTULLOH!

Room 3/ 66 Unison Road, Strathtulloh, Vic, 3338

Description

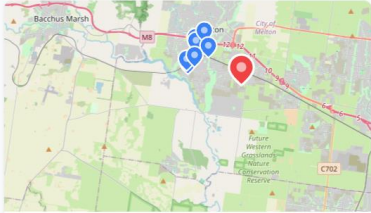

Modern Furnished Co-Living Home – Private Ensuite Room I Optional Garage Space Available

Ideally located just moments from local shops and beautiful parklands, this fully furnished co-living home is designed for easy, comfortable living. Whether you're a student or working professional, this home offers a perfect blend of privacy, functionality, and community.

Enjoy your own private furnished bedroom with an ensuite bathroom, while sharing thoughtfully styled common areas, including a spacious open-plan kitchen and two inviting living zones — perfect for relaxing after a long day.

What's on Offer:

- ? Private Bedroom with Ensuite
- Fully furnished with a queen bed frame and bedside table (BYO mattress)
- Lockable door for your privacy and peace of mind
- ? Utilities & Wi-Fi Included
- Just \$40 P/W for electricity, gas, water, Wi-Fi, and shared consumables
- Total weekly cost: \$210 P/W

★ NaN / 5 (1 rating)

Your rating: 3/5 — Update it?

Update Rating

Nearby in 3338

</ratings>

Called in RatedRentals.jsx via `getRatedRentals(token)` using the Bearer token stored in AuthContext. The endpoint returns a list of rating objects for the logged-in user. Since this endpoint only returns rating data (not property details), the page makes a secondary parallel call to `/rentals/{id}` for each rating via `getRental()` to enrich the display with property title, rent, type, suburb, state, and bedroom/bathroom/parking counts. Individual cells display an animated shimmer skeleton while their data is loading, providing progressive feedback rather than a full-page spinner.

</ratings/rentals/{id}> (GET)

Called in RentalDetail.jsx via `getRating(id, token)` to retrieve the current user's existing rating for a specific property. If a rating exists, it pre-fills the star rating widget and adjusts the submit button label to "Update Rating". This ensures users always know what rating they have previously given.

The screenshot shows a rental listing for a "SMALL ROOM WITH NO WINDOW - NO PETS - CLOSE TO SHOPS" located at 4/56 Kenihans Road, Happy Valley, SA, 5159. The listing includes a description, a map, and a community rating section.

Description:

INSPECT FRIDAY NIGHT 27TH FEB AT 6PM TO 7PM
Phone Rob de Jonge direct on [REDACTED PHONE]

HIIIIII FRIENDS -

We have a room becoming available from 1ST MARCH 2026, located in Happy Valley, South of Adelaide.
\$150 a week PLUS Electricity of \$150 PQ.

My home is more of a HOTEL than a Rooming House. I own the home and live in it with FOUR other renters, all 3 professionals that are always at Work.

SINGLE bedroom fully furnished, can come unfurnished if needed.

We have 2 large living rooms as well as fantastic outside entertainment area. Could suit student or professional, close to Marion, Flinders Uni & public transport on the door step. 2 minutes from local shops.

Reach out if you are interested! [REDACTED PHONE]

Map: A map showing the location of the property in Happy Valley, SA, near Woodcroft and Reynella East.

Community Rating: NaN / 5 (8 ratings)

Your rating: 4/5 — Update it?

Update Rating

</user/register> (POST)

Called in RentalDetail.jsx via `postRating(id, rating, token)` when the user submits or updates a star rating. The request includes the rating value (1-5) and the Bearer token. Success and error states are communicated to the user via Bootstrap Alert components. Only authenticated users see the rating form, unauthenticated users see a prompt to log in.

The screenshot shows a "Create Account" form with the following fields:

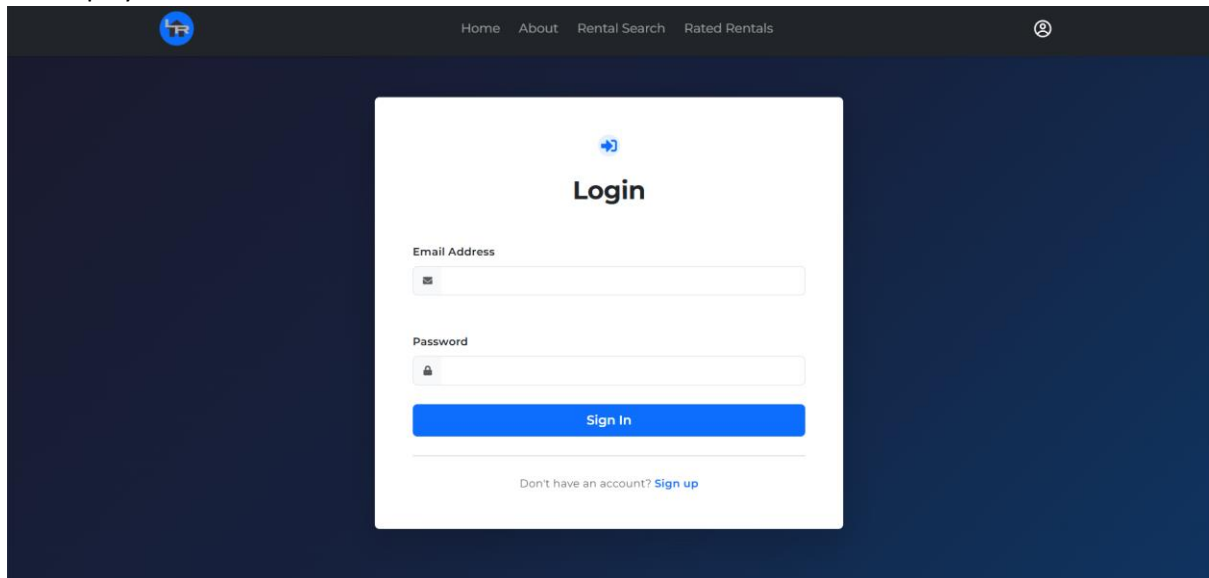

- Email Address: you@example.com
- Password: At least 6 characters
- Confirm Password: Repeat your password

There is a "Create Account" button and a link to "Sign in here" if the user already has an account.

</user/login>

Consumed in Login.jsx via `apiLogin(email, password)`. On success, the returned JWT token is extracted from the response (checking token, bearerToken.token, and access_token fields for API compatibility) and stored both in localStorage (for persistence across page reloads) and in React context via AuthContext. The user is then redirected to the home page. Error messages from the API

are displayed to the user.

Modules Used

This is just a list of the external modules that you have used. You need not specify core React modules. In each case, ***we want the name, a brief description, and a link to the docs at npm or github or wherever.*** The example is `react-router` as most people will be using this. Just copy that style and add more as necessary.

Module	Description	Reference
React 18	Core UI library for component-based development	https://react.dev/
React Router v6	Enables SPA routing with path-based navigation and URL parameters	https://reactrouter.com/
React Bootstrap 2	Bootstrap component library adapted for React: Container, Card, Table, Form, Badge, Spinner, Pagination, Alert, Modal and more	https://react-bootstrap.netlify.app/
Bootstrap 5	Base CSS framework providing utility classes, grid and theme variables	https://getbootstrap.com/
Axios	Promise-based HTTP client for all REST API calls	https://axios-http.com/
Pigeon maps	Lightweight, React map component used to display property location with marker pins around on the RentalDetail page	https://pigeon-maps.js.org/
AOS (Animate on Scroll)	Scroll-triggered animation library used to fade/slide pages in on load	https://michalsnik.github.io/aos/

Weaknesses:

- The search page requires the user to explicitly press the Search button even on the initial load. There is no auto-search on filter change, which means a user changing the State dropdown must still click Search (can be confusing). Adding a debounced auto-search or at minimum a visual cue (e.g. greying out the results when a filter changes) would improve this.
- The Rated rentals table makes N+1 API calls (one per rated property) on load, which can cause noticeable loading delays and may trip API rate limits for users with many ratings. A loading skeleton or progressive reveal would reduce this perceived latency.
- The map view on the Search page shows only the properties loaded so far. Meaning not all results in the database for those filters. Users may not realise the map is incomplete if they have not yet clicked "Load more".
- Mobile responsiveness is partially addressed by Bootstrap's grid, but the search results table does not adapt well on smaller screens. A card-based mobile view would be more user-friendly.

Accessibility

An audit of the application against the W3C Priority 1 Accessibility Requirements reveals the following:

Non-text elements: React-icons renders icon components without alt text or aria-label attributes. For example, the FaSearch, FaHouseUser, and FaStar icons used on the Home page and in table cells convey meaning but no accessible text equivalent. This fails Checkpoint 1.1 Mitigation: add aria-label or title props to all standalone icon usages.

Colour as the only means of conveying information: The search results table uses green text for rent values and coloured badges (primary blue for state, secondary grey for type, warning yellow for star ratings). For users with colour vision deficiency, the rent colour provides no additional information beyond the dollar sign, so this is low risk. However, the star rating widget relies entirely on yellow/grey colour to show selection state, with no other indicator. This partially fails Checkpoint 2.1.

Readable without stylesheets: The application is a React SPA and relies entirely on JavaScript to render content. Checkpoint 3.1 (readable without stylesheets) is technically met since Bootstrap provides semantic HTML structure, but the app is completely non-functional without JavaScript. A more fundamental accessibility concern not directly addressed by WCAG Priority 11 checklist. This is a known limitation of SPA architecture.

Screen animation: AOS (Animate on Scroll) causes fade-in transitions when the page loads. These are CSS opacity transitions (not flashing), so it is unlikely to trigger photosensitive epilepsy responses and are considered compliant with Checkpoint 7.1.

Language clarity: The application uses plain, professional English throughout the UI. Navigation labels are standardised, such as "Home, Search, Login" and form labels are explicit (e.g. Min Rent, Min Bedrooms). This satisfies Checkpoint 14.1.

Table headers: The search results table uses a <thead> with <th> elements and dark Bootstrap class, which provides visual contrast for the user. However, no scope attribute is set on the th elements (scope='col'), which is required for screen reader compatibility. This is a minor issue but a fixable gap.

Cultural and Indigenous Accessibility:

The application includes an Acknowledgement of Country at the footer on the "About" page of the website. Given that the dataset covers rental properties across Australia including regions with

significant Aboriginal and Torres Strait Islander populations. An acknowledgement of Country is appropriate and culturally respectful.

The application's imagery (the About page) shows properties in Logan Central, Woodridge, and Inala areas with notable Indigenous and CALD communities. Care should be taken to ensure these representations are accurate and non-tokenising. The current placeholder images are generic property photos, which is safe but could be enhanced with community-appropriate content.

The application is English-only and assumes desktop-first access patterns. For rural and remote Aboriginal and Torres Strait Islander communities, mobile-first design and lower-bandwidth optimisation (e.g., image lazy loading, smaller bundle sizes) would improve equitable access.

Technical Description

Architecture

The application follows a standard React SPA structure with clear separation of concerns:

Directory/File	Purpose
Src/api/rentals.js	Centralises all Api calls using axios. Each function maps to one endpoint, accepting parametrers and returning the axios promise. No business logic lives here.
src/context/AuthContext.jsx	Provides global authentication staste (token, login, logout) via React Context. The token persisted to localStorage so sessions survive page reloads. All authenticated API calls read the token from this context.
Src/components/Navbar.jsx	Persistent navigation bar rendered on every route. Reads auth state from context to conditionally show Login/Logout controls. Contains the unauthenticated user Modal dialog.
src/pages/Home.jsx	Landing page with hero image, feature cards, and navigation CTAs. No API calls.
src/pages/About.jsx	Brand/marketing page with location feature cards. No API calls.
src/pages/Search.jsx	Primary search interface. Fetches states and property types on mount. Executes filtered, sorted, paginated searches against /rentals/search. Manages all filter, sort, and pagination state locally with URL sync via useSearchParams.
src/pages/RentalDetail.jsx	Individual property view. Fetches property by ID, renders Pigeon Maps, and provides the authenticated star rating widget.
src/pages/Login.jsx, Register.jsx	Authentication forms. Validate input client-side, call auth endpoints, store JWT on success.
src/App.jsx	Root component. Wraps routes in BrowserRouter. Defines all route paths.

Data flow follows a unidirectional pattern: User interaction triggers state changes or API call in page-level components, which update local state and re-render the UI. The AuthContext is the only global state. All other state is local to its respective page component. URL search parameters (useSearchParams) are used on the Search page to synchronise filter/sort/page state with the browser URL, which enables bookmarkable searches.

Test plan

No.	Test case	Endpoint	Expected result	Type	Pass/Fail
1	Search all properties (no filters)	/rentals/search	Virtual table populated with results	Positive	Pass
2	Filter by state = QLD	/rentals/search	Only QLD properties returned	Positive	Pass
3	Filter chips appear: click 'x' removes filter	/rentals/search	Chip removed, search re-executes	Positive	Pass
4	Load more button appends rows	/rentals/search	Next page appended, scroll position preserved	Positive	Pass
5	Sort by Bedrooms Descending	/rentals/search	Fresh search, results ordered by most beds first	Positive	Pass
6	Switch to map view	N/A	Pigeon maps show all loaded result pins	Positive	Fail
7	Click map pin navigates to property	/ratings/{id}	RentalDetail page loads	Positive	Pass
8	Bookmark URL with filters, reload page	/rentals/search	Filters restored, search auto-executes	Edge	Pass
9	View rental detail	/ratings/{id}	Detail & map with red pin, nearby blue pins	Positive	Pass
10	Click nearby blue pins on map	/ratings/{id}	Navigates to the rentals detail page	Positive	Pass
11	Share button copies URL	N/A	Clipboard contains current page URL	Positive	Pass
12	Register new user	/user/register	Account created, auto login, redirect to Home	Positive	Pass
13	Login with valid credentials	/user/login	Token stored, nav shows Logout, rated rentals visible	Positive	Pass
14	Submit star rating while logged in	/ratings/rentals/{id}	Success alert shown, rating updates	Positive	Pass
15	View Rated Rentals while logged in	/ratings	Table shows shimmer then enriched property details	Positive	Pass
16	Register with duplicate email	/user/register	Error: email already in use	Negative	Pass
17	Login with wrong password	/user/login	Error: invalid credentials	Negative	Pass
18	Access /rated while not logged in	N/A	Modal dialog prompts to login	Negative	Pass
19	Search with no results	/rentals/search	Empty state card with friendly message	Edge	Pass

20	Navigate to non-existent rental ID	/rentals/{id}	Error state shown with back to Search button	Edge	Pass
----	------------------------------------	---------------	--	------	------

Difficulties / Exclusions / unresolved & persistent errors

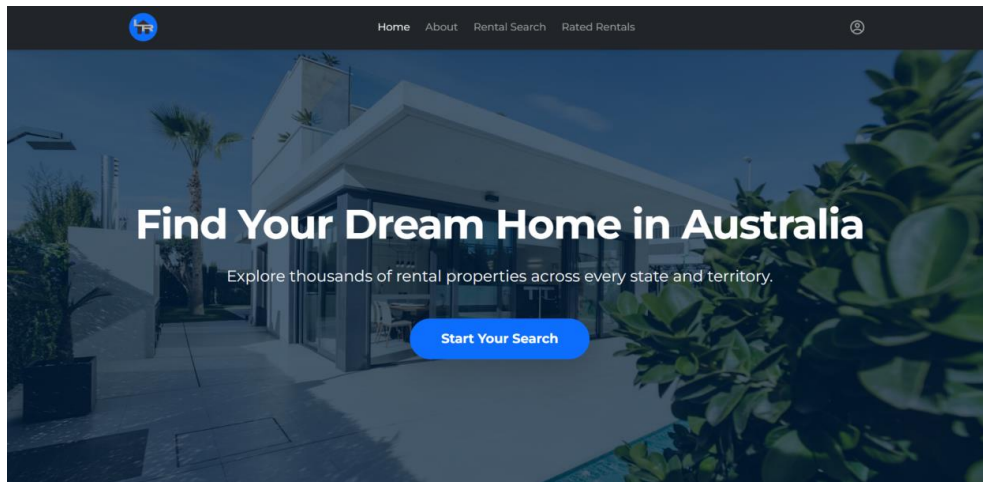

- **JWT token extraction:** API response format nested the token under bearerToken.token rather than a top-level field. This was resolved by using a fallback chain: `res.data?.token ?? res.data?.bearerToken?.token ?? res.data?.access_token`.
- Virtual scroll table: implementing server-side pagination within a virtualised row model required decoupling the “page” concept from the user visible scroll position. The solution accumulates all fetched rows in a single `allRows` array and uses `ResizeObserver` to compute the visible row window, while load more fetches append to the array without resetting scroll.
- **Filter chip state:** Removing a single chip required updated the 4 corresponding state variable and re-building the API params object in the same render cycle. This was resolved by using a `setTimeout(0)` flush to ensure the state setter had transmitted before `buildParams()` was called.
- **Nearby properties on the map:** Initially there was a lot of problems with implementing the properties on the map as well as placing the marker. This was resolved by filter out the current rental ID from the nearby results before rendering.
- Rated Rentals N+1 problem: `/ratings` endpoint returns only IDs, and not property data. Enriching each rating with a separate `/rental/{id}` call creates N parallel request. `Promise.allSettled` was used to handle partial failures gracefully. Shimmer skeleton cells provider progressive feedback while enrichment is in progress.
- **Images used on website:** Images were previously referenced using `src/pictures/..` paths which resolve correctly in the Vite dev server but would not in the production build. All images were converted to `/pictures/..` a public folder to ensure the build is successful.
- **Full map view:** Initially tried implementing a map view which enlarges when the icon is clicked. At first the feature worked however bugged the system and did not display the correct pinpoints. Ultimately, opted to scarp the idea entirely and just have the preview pigeon maps.

Extensions (Optional)

- Client-side property comparison: allow users to select multiple properties from search results and view a side-by-side comparison card.
- Favourites/Watchlist: a local or server-side list of properties the user wants to track without needing to rate them.
- Toast notifications instead of inline Alert components for rating submissions, providing less disruptive feedback.
- Dark mode support: the `index.css` already includes `prefers-colour-scheme` media query variables, so a toggle could be added with minimal effort.
- Improved mobile layout: a card-based view for search results on narrow screens instead of a horizontally scrolling table.

User guide

Once the application is on a browser, the user will be greeted by the Home page with a hero image greeting the user to the application. No login is required to browse and search properties.

Searching for properties

- Click rental search in the navigation bar.
- Use the State and property type dropdowns to filter by location and property category.
- Enter a postcode (4 digits) or suburb name for more targeted searches.
- Click the Advanced Filters chevron to reveal additional filters: Min/Max rent, Min/Max bedrooms, Min Bathrooms and Min Parking.
- Click the Search button to execute the query.
- Active filters appear as chip badges below the search bar. Click the x on any chip to remove that filter instantly.
- Results appear in a virtualised table. Click any column header in the sort of dropdown to sort and use the direction toggle for ascending/descending.
- For map view, the user is supposed to click on the map logo and will enlarge into a bigger view. However, due to limited constraints, it would not be completed.
- Click load more at the bottom to fetch the next page of results and append them to the table.
- Click any row to open the property detail page.

SMALL ROOM WITH NO WINDOW - NO PETS - CLOSE TO SHOPS

4/56 Kenihans Road, Happy Valley, SA, 5159

Description

INSPECT FRIDAY NIGHT 27TH FEB AT 6PM TO 7PM
Phone Rob de Jonge direct on [REDACTED PHONE]

Hiiiiiii FRIENDS -

We have a room becoming available from 1ST MARCH 2026, located in Happy Valley, South of Adelaide.

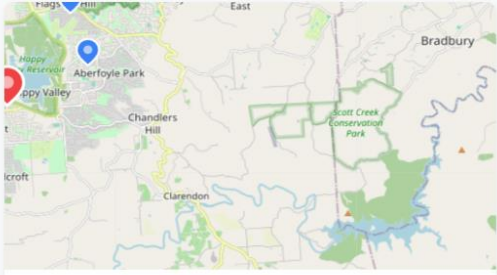

\$150 a week PLUS Electricity of \$150 PQ.

My home is more of a HOTEL than a Rooming House. I own the home and live in it with FOUR other renters, all 3 professionals that are always at Work.

SINGLE bedroom fully furnished, can come unfurnished if needed.

We have 2 large living rooms as well as fantastic outside entertainment area. Could suit student or professional, close to Marion, Flinders Uni & public transport on the door step. 2 minutes from local shops.

Reach out if you are interested! [REDACTED PHONE]

Appendices

Home page

The screenshot shows the home page of the LarpRentals website. The header is dark with the LarpRentals logo on the left and navigation links (Home, About, Rental Search, Rated Rentals) in the center. A user profile icon is on the right. The main banner features a modern house at night with the text "Find Your Dream Home in Australia" and "Explore thousands of rental properties across every state and territory." A blue button labeled "Start Your Search" is positioned below the text. Below the banner, the section "Why Choose LarpRentals?" is followed by the tagline "Everything you need to find the perfect place." Three white boxes highlight key features: "Extensive Listings" (with a house icon), "Advanced Search" (with a magnifying glass icon), and "Community Ratings" (with a star icon). Each box contains a brief description of the feature.

Find Your Dream Home in Australia

Explore thousands of rental properties across every state and territory.

Why Choose LarpRentals?

Everything you need to find the perfect place.

- Extensive Listings**
Access the most comprehensive database of rental properties updated for the current market conditions.
- Advanced Search**
Filter by state, property type, price, and more to easily find exactly what you're looking for.
- Community Ratings**
Log in to interact with our community, leave ratings on properties, and view your history.

About Us

The screenshot shows the "About Us" page of the LarpRentals website. The header is dark with the LarpRentals logo on the left and navigation links (Home, About, Rental Search, Rated Rentals) in the center. A red "Logout" button is on the right. The main image is a photograph of a house at night with the text "About Us" overlaid in white. The house has a large tree in front and a fence in the foreground.

About Us

Our Goal

Welcome to LARP Rentals, where we redefine the short-term stay experience across Australia.

Founded on the principle that a rental should be more than just a place to sleep, we specialize in high-quality properties that serve as the ultimate backdrop for your next chapter whether that's a professional retreat or a weekend of pure escapism.

Our team knows that the best stories are the ones you live out loud. We draw inspiration from those "larger than life" moments like LARPing in a Ferrari through the neon-soaked streets of Miami and bring that same energy and premium standard to the Australian rental market.

At LARP Rentals, we don't just provide a roof; we provide the stage for your next great adventure. From sleek urban apartments to coastal escapes, we ensure every stay is lived at full throttle.

LARP Rentals acknowledges the Traditional Custodians of the lands on which our properties are located and pays respect to Elders past, present, and emerging. We recognise the continuing connection of Aboriginal and Torres Strait Islander peoples to land, water, and community.
